Section 1: Executive Summary

The aim of this project is to provide a modern web application for a not-for-profit organization focused on environmental education and climate literacy. The organisation focuses on improving community understanding of local climate issues and encouraging people to take practical climate action. Although climate information is widely available online, it can be very time-consuming to search the information and the information can be difficult for people without an environmental background to understand. The modern web application will therefore be a central and accessible portal for users to learn more about environmental issues, explore different resources, and participate in local environmental activities.

The target audience of this website includes students and young people in Melbourne who are interested in learning about climate change and sustainability. It will also support educators looking for accessible and reliable teaching resources. These users have various needs, such as accessing trustworthy environmental information for learning and finding opportunities to participate in local climate action.

The web application will address these needs through a resource hub that provides educational materials on topics such as renewable energy, sustainable living, and waste reduction. Users will be able to search and filter resources, rate useful educational content, and create accounts to access personalised features. Additionally, users will be able to create and submit their own environmental resources, allowing them to contribute relevant content and share knowledge with the wider community. A Get Involved option will also be available for users to explore opportunities to participate in sustainable activities with locations and details. A Melbourne Climate Action Map will also help users discover local environmental activities. Location-based search and navigation features will make it easier for users to find nearby activities and turn their online learning into real-world environmental participation.

Research into existing environmental and educational organizations in Australia, including CERES, Cool.org, and the Climate Council, provided insights into the content and structure of this application. These organizations demonstrate the value of practical environmental education, easily accessible learning resources, and evidence-based climate information. Based on this research, the application aims to create an inclusive, responsive, and engaging digital experience to enhance public climate literacy and empower Melbourne communities to make informed and meaningful environmental choices.

Declaration: Additional Help

Any tools that you used (including Gen AI or existing code reuse) must be declared here.

Note: GenAI is not allowed for coding purposes in any assignment,

However, you may use GenAI for brainstorming, problem solving and learning. You need to declare all such uses here. One row per help used. More details on how to acknowledge the use of Gen AI can be found [here](#).

Name	Description
<i>Example: ChatGPT for brainstorming ideas</i>	<i>I used ChatGPT to brainstorm how to do X because I was feeling stuck with Y problem.</i>
ChatGPT – Brainstorming and Planning	I used ChatGPT to brainstorm ideas for the environmental education and climate literacy web application, including possible website features, target users, and the overall website structure.
ChatGPT – Writing and Language Support	I used ChatGPT to review the wording and grammar of parts of the report and suggest clearer ways to express my own ideas.
